

MathGov Core Component Map v11.4

Status: Navigation and maturity dashboard. Informative unless explicitly incorporated by the release package.

Purpose: Show the role, authority, documentation completeness, and measurement maturity of each MathGov and RippleLogic artifact.

1. Two-axis honesty rule

This map reports two different maturity surfaces.

Documentation / source completeness asks:

- Is the artifact's scope defined?
- Are its inputs and outputs clear?
- Is its authority boundary clear?
- Are non-claims clear?
- Is it aligned with the Canon and source hierarchy?
- Is it usable as a Tier 1-3 source specification?

Measurement maturity asks:

- Does the artifact rely on measured quantities?
- Are those measurement instruments defined?
- Are they validated?
- Are they independently replayable?
- Is there reliability evidence?

A document can have high documentation completeness and low measurement maturity. That means the artifact is well-specified but not yet empirically instrumented.

Neither score is:

- empirical validation;
- ProofPack readiness;
- Tier 4 readiness;
- legal certification;
- deployment certification;
- reference-calculator status;
- evidence of superior decisions.

2. Measurement maturity scale

Level	Name	Meaning
N/A	Not applicable	Conceptual, structural, or navigational artifact; no measurement instrument required
M0	Undefined instrument	Measurement need identified, instrument not yet defined
M1	Provisional heuristic	Guidance-stage or training-stage method; no reliability evidence
M2	Domain-supported	Declared indicators or instruments exist; reliability not yet established
M3	Reliability-tested	Inter-rater reliability, replay, or domain reliability evidence exists
M4	Independently validated	External replay, validation, and cross-context evidence exist

3. Core component map

Component	Version	Role	Authority	Documentation status	Measurement maturity
RippleLogic Canon	v11.4	Governing decision architecture	Normative source	High documentation completeness	N/A for cascade specification; M1 for RLS cell scoring
Sentience Gradient Protocol	v6.4	Moral-status and rights-of-protection interface	Companion protocol	High documentation completeness	M1 artificial-entity guidance; M0-M1 biological evaluation
RippleLogic Agent System	v11.4	Agent runtime, controls, audit, conformance	Operational companion	High documentation completeness	M1 procedural architecture; field validation not yet complete
ripple.md Standard	v4.4	Portable assurance and Decision Note wrapper	Interoperability standard	High documentation completeness	N/A process wrapper; M1 for real-world adoption evidence
RippleLogic Cascade Standard	v1.0	Compact cascade reference	Release standard	High documentation completeness	N/A specification summary
CSV Gate Standard	v1.2	Containment and Structural Viability gate standard	Gate standard	High documentation completeness	M1 structural-viability heuristics; UCI/HOI not validated

Component	Version	Role	Authority	Documentation status	Measurement maturity
Foundations Primer	v3.4	Human doorway and teaching artifact	Informative companion	High documentation completeness	N/A
Aligners Sheet	v4.4	Worked-run exemplar workbook	Tier 1-3 exemplar, not validator	Substantial worked-run completeness	M1 worked-run model; formula audit pending; not calibrated
RLS Validation Protocol	v1.0	Study design for RLS reliability and non-redundancy	Companion validation artifact	Substantial protocol-design completeness	M0->M1; defines path toward M3
UCI / HOI diagnostics	within Canon and CSV	Structural coherence and hollowing / overhang diagnostics	Load-bearing diagnostic when material	Included in Canon / CSV	M0-M1; no cross-domain validated instrument
Computability vs Realizability Bridge	v11.4 surface	Generated != grounded != selectable != ethical guard	Canon bridge / guide surface	High documentation completeness	N/A

4. Companion guidance additions

These artifacts are informative and non-normative. They sit below the Canon, SGP, Agent System, ripple.md Standard, Cascade Standard, and CSV Gate Standard.

Artifact	Role	Authority	Documentation completeness	Measurement maturity
RIPPLELOGIC_PLAIN_ENGLISH_SUMMARY.md	Public orientation doorway	Informative, non-normative	New	N/A
RIPPLELOGIC_COMPARATIVE_POSITIONING_AND_RELATED_WORK.md	Academic positioning and related work note	Informative, non-normative	New	N/A
RIPPLELOGIC_IMPLEMENTATION_SCAFFOLDING.md	Provisional heuristics, PCC profiles, roles, and fast-path guidance	Informative, non-normative	New	M1 only; heuristics capped at E1-E2 unless independently supported
PCC_LITE_WORKED_EXAMPLE_REUSABLE_CUPS.md	Minimal worked example	Informative, non-normative	New	M1 training-grade example

5. Honest dashboard reading

The MathGov Core is strong on documentation and source completeness. Its major governing artifacts are mature as Tier 1-3 specifications.

The main measurement surfaces are less mature:

- **RLS cell scoring:** M1 until rater studies and dimensional separability tests are completed.
- **UCI/HOI:** M0-M1 until a measurement annex and domain indicators are validated.
- **Biological SGP:** M0-M1 until biological evaluation batteries are specified and tested.
- **Artificial-entity SGP:** M1 until architecture, continuity, valence, robustness, and anti-gaming tests are validated.
- **Aligners Sheet:** M1 as a worked-run exemplar until formula audit, test vectors, and reference-calculator replay are complete.

This is not a weakness if stated honestly. It means the framework is ready for validation work, not finished with validation work.

6. Priority maturity roadmap

Priority	Target	Current maturity	Desired next maturity	Next step
1	RLS cell scoring	M1	M3	Inter-rater reliability and dimensional separability study
2	RLS 49-cell non-redundancy	M1	M3	Separability-case protocol plus correlation/factor analysis
3	UCI/HOI	M0-M1	M2	Provisional UCI Measurement Annex
4	Aligners Sheet	M1	M2	Formula audit and public test vectors
5	SGP biological evaluation	M0-M1	M2	Biological Evaluation Annex
6	SGP artificial-entity evaluation	M1	M2	Artificial Entity Evaluation Annex
7	Reference calculator	M0	M2	mathgov-reference v0.1 replay of Canon test vectors
8	Pilot use	P1-P3 preparation	P3	Shadow-mode pilot design

7. Score boundary

Documentation status labels are internal source-completeness indicators, not numeric validation scores.

Measurement maturity scores are self-assessed instrument-readiness indicators.

They are not:

- empirical validation;
- proof of better decisions;
- legal certification;
- deployment certification;
- ProofPack status;
- Tier 4 readiness;
- automated moral truth.

8. Final component-map statement

MathGov Core v11.4 is source-complete enough to proceed toward validation, but its major measurement surfaces must be advanced through reliability testing, measurement annexes, reference-calculator replay, and pilots before stronger empirical claims are made.

Legacy verifier phrase: documentation/source-completeness scores are documentation/source completeness indicators only, not validation claims.
