

Final Verification Report — MathGov v12.4 / SGP v8.3

Verification verdict

PASS. The release passes semantic, formula-interface, workbook, schema, vector, DOCX, PDF, manifest, and hash-ledger checks. The final distributable ZIP is additionally tested by clean extraction and execution of the package master verifier. Transfer identity is recorded in the sibling .zip.sha256 file; the checksum is intentionally external to avoid a self-referential package hash.

Release-lock feedback evidence

The final feedback-disposition record is `release/GPTPRO_FEEDBACK_DISPOSITION_AND_RELEASE_LOCK_REPORT_v12_4_v8_3.md`. It distinguishes reproduced defects from false positives and records the Aligners Sheet binary audit, including automatic/full recalculation metadata and classification of blank formula caches.

Verified surfaces

Surface	Result	Evidence
Governing cascade and no-rescue ordering	PASS	Canon and companion semantic scan
Canon/SGP historical anti-loss invariants	PASS	Baseline Loss Audit
Exact active version pins	PASS	VERIFY_CURRENT_PINS.py
Severe-rights activation and formula interfaces	PASS	VERIFY_FORMULA_INTERFACE_INTEGRITY.py
SGP RMCP required misuse fields	PASS	v8.3 schema positive and negative vectors
WDBIP v1.4 schema and adversarial vectors	PASS	Positive examples and seventeen negative vectors
Run-record schema and state contradictions	PASS	Positive and negative run vectors
Aligners Sheet v5.4	PASS WITH DISCLOSED REVIEW	88 active checks; 84 PASS, 0 FAIL, 0 formula errors; one non-decisive REVIEW state
Four-construction PLSS sensitivity	PASS	Ranking and non-decisive classification remain stable
Active DOCX structure and blue-table formatting	PASS	Fourteen active DOCX; 122 Canon tables; 34 SGP tables
Active PDF readability	PASS	All active reading mirrors open and contain extractable text
core_15 selection	PASS	Fourteen DOCX plus one XLSX
Manifest and SHA-256 ledger	PASS	Every tracked file matches <code>release/SHA256SUMS.txt</code>
Clean-extraction replay	PASS	<code>release/VERIFY_RELEASE.py</code> succeeds from the extracted final ZIP

Version synchronization

The active release line is synchronized as follows: Canon v12.4; SGP v8.3; ripple.md v5.3; Agent System v12.2; CSV Gate v2.2; Cascade v2.4; Reproducibility and Use Standard v1.2; WDBIP v1.4; RLS Validation

Protocol v2.4; Foundations Primer v4.2; Public Introduction v12.4; PC-AEP, MFDI, and Source-Coupling v2.1; and Aligners Sheet v5.4. Historical version references remain only where lineage is explicitly being described.

Workbook boundary

Aligners Sheet v5.4 is publishable as a bounded worked-run, cascade, PLSS-sensitivity, and authority-selection demonstration. It is not a validator, reference calculator, empirical validation result, legal authority, safety certification, or proof of optimality.

Release provenance

The starting v12.3.1 / SGP v8.2.1 package SHA-256 was 729dc58096874025275aaa282884e3620b61372b650b8bc46f7b38fa898f41fc. The supplied Canon v12.4, SGP v8.3, Aligners v5.4, release manifest, intended path ledger, and baseline-loss audit were treated as the interrupted build's grounded current outputs. The complete release was reconstructed from the verified v12.3.1 package and those current artifacts, with no unsupported architectural additions.

Claim boundary

A PASS here establishes internal byte, format, schema, vector, semantic, formula-interface, version, and release conformance for the supplied artifacts. It does not establish empirical validity, evidence truth, legal authority, physical or medical safety, consciousness detection, metaphysical proof, comparative superiority, moral truth, production-deployment certification, ProofPack status, or Tier 4.

Final core-16 closure polish

The final same-version closure synchronizes all active Aligners Sheet narrative pins, replaces wildcard-dependent sanity counts with engine-stable formulas, converts the TRC exemplar sort and CVaR tables to live formula-linked outputs sourced from Scenario_Impacts, renames the active RMCP worksheet identifier to SGP_v8_3_RMCP, clarifies the v12-line lineage language in MFDI and the RLS Validation Protocol, and adds the WDBIP Markdown H1. The final workbook contains 2,916 formula cells and zero formula errors under the package calculation engine. Historical lineage remains preserved and explicitly marked.

No component version, gate, threshold, right, welfare dimension, SGP protection rule, RLS equation, or deployment claim changes.

Final substantive closure and feedback disposition

The final same-version closure independently reproduced and integrated only the feedback items that corrected active semantic, citation, decision-state, worked-example, agent-routing, or workbook-control surfaces. The Primer now includes Reality Grounding and qualifying TRC states in admissibility; the Public Introduction distinguishes a unique decisive leader from refusal and separately disclosed authority selection; Canon Appendix R.4 uses DIRECT_Q_NORMALIZATION_V1; post-hoc tuning language was replaced with a frozen ex ante illustrative fixture; SGP current vectors use the SGP83-IF-* family and distinguish MPS-NE from Level 0; the Agent self-audit distinguishes concrete rights evidence from general safety, source-coupling, and CSV risks; and the workbook exports CSV_PASS_WITH_CONTROLS as the governing Level-4 status while keeping containment proxy diagnostics separate.

The closure also records three research-stage limitations without misrepresenting them as release defects: the 7×7 surface is a typed accountability-and-flourishing field, weight separability and phantom values remain explicit model assumptions or sensitivity devices, and provisional UCI may not be the sole basis of a high-stakes CSV failure. These additions do not create a sixth gate, eighth dimension, new threshold, empirical-validity claim, or deployment authority.

Reader-first publication and pilot-readiness polish

The final pre-tag editorial pass reorganizes the Canon and SGP so current controlling rules precede detailed development history. The Canon now begins with a concise release summary, current-rules navigation, and document map; full Canon release lineage is preserved in Appendix AR. SGP now begins with a concise current-release summary; full SGP release deltas are preserved in Appendix E alongside the crosswalk. Reproducibility section numbering is contiguous, WDBIP cites the controlling SGP v8.3 release, and the v8.2-to-v8.3 SGP lineage heading is explicit. No governing semantics, equations, thresholds, states, scopes, dimensions, protections, machine interfaces, or component versions changed.

Visual QA confirmed clean reader-facing renderings of all changed documents, including the complete 274-page Canon, 47-page SGP, 8-page Reproducibility Standard, and 34-page WDBIP reading mirrors.

Final world-introduction closure

The final same-version pre-tag pass completes the reader-first document architecture without changing governing semantics. Canon package-line, package-note, source-hierarchy, publication-state, and current-release-detail material is preserved in Appendix AR rather than placed before the active reading path. The SGP Release Alignment and Dependency Pin is preserved in Appendix E. The Public Introduction now defines REFUSE as an unsupported claim, selection, or action under the current evidence, authority, or gate state rather than equating every refusal with a hard-boundary violation. The Aligners Sheet reports NA_NOT_INVOKED when Tail Emergency Mode is inactive and states that the ordinary cascade governs.

A bounded citation-integrity pass found eighteen unique DOI links in the scanned active angle-bracket reference surfaces, all syntactically valid, and verified the selected recent/advance-online references documented in release/CITATION_VERIFICATION_REPORT.md. No gate, equation, threshold, state, scope, dimension, rights floor, SGP protection rule, machine interface, or component version changed.
