

GPTPro Feedback Disposition and Release-Lock Report

MathGov Core Release 2026.09 v12.4 / SGP v8.3

19 July 2026 | Pre-publication release-lock correction | Complete supplied ZIP

Executive verdict

The feedback contained genuine defects and major false positives caused by auditing an incomplete or transformed evidence surface rather than the supplied release ZIP. The five-stage architecture remains sound and unchanged:

RG -> RF/NCRC -> TRC -> CSV -> RLS

No sixth gate, eighth welfare dimension, new moral-status hierarchy, capacity-to-authority inference, or empirical-certification claim was added. Accepted corrections improve calculability, version identity, record-schema clarity, navigation, and release portability. Unsupported suggestions were rejected.

Disposition summary

Feedback item	Disposition	Reason and action
Preserve five-stage architecture; do not add a sixth gate	Accepted invariant	Architecture retained exactly.
Canon duplicate Appendix AJ and content after final statement	Accepted	Current Rules-Only Navigation is Appendix AP; current machine-state contract is Appendix AQ; the completion statement is now the actual end.
Rights-floor aggregation/saturation underdefined	Accepted	Added explicit adverse-instance aggregation, saturation, default beta binding, subgroup/worst-affected-group relationship, and claim boundary.
max over empty set convention missing	Accepted	Added reviewed-empty-set rule: zero only after completed review; missing evidence remains UNKNOWN/escalate/refuse.
UCI Appendix B formula inconsistent with NA/UNKNOWN handling	Accepted	Replaced with applicable-component renormalization; NA excluded; UNKNOWN not scored; U1/U7 Equity treatment explicit.
Legacy phantom-instance s=1 notation	Accepted	Replaced with registered $h_{\{k,base\}=1}$ and $h_{\{k,welfare\}=1}$ fields.
WDBIP v1.4 identity drift	Accepted	Current v1.4 identity, history, schemas, validators, citations, PCC terminology, and lineage labels synchronized.
Stale current component pins	Accepted where active	Current surfaces synchronized; legitimate history retained and more clearly marked as lineage.
SGP RMCPRecord duplicate minimum schemas	Accepted	One controlling minimum RMCPRecord retained; the other field set is explicitly a nested dimension-profile subrecord.

Feedback item	Disposition	Reason and action
Workbook calculation metadata absent	Accepted	Set calcMode=auto, fullCalcOnLoad=1, and forceFullCalc=1; recalculated; opened on How_To_Use; current sync tab placed before historical sync.
Workbook NONDECISIVE_GAP_REVIEW is a defect	Rejected	It is an intentional, nonblocking review notice because the worked run correctly refuses deterministic selection.
640 formula cells with blank caches prove calculation loss	Reframed	All 640 were checked after recalculation: 569 legitimately evaluate to empty-string and 71 to blank/null; zero evaluate to a nonblank missed result. The absent recalculation flags were the genuine issue.
Reproducibility Standard v1.2 and Validation Workbook v0.2 missing	Rejected	Both are present in the actual ZIP and manifest.
State registry, transition matrix, maturity register, schema and validator missing	Rejected	All named machine assets are present and verifier-tested.
No README, LICENSE, CHANGELOG, hashes, manifest or verification layer	Rejected	All are present in the actual package.
DOCX files are Markdown renamed as DOCX	Rejected	Active DOCX files are genuine OOXML Word packages; canonical Markdown and derived DOCX/PDF mirrors are intentionally both supplied.
Replace Word mirrors with Markdown-only release	Rejected	The current source hierarchy is stronger: Markdown is canonical and diffable; genuine DOCX/PDF mirrors support human review and accessibility.
Add new conceptual core artifacts	Rejected	No additional conceptual core is required; empirical testing has higher value than expanding the normative surface.
Public claim that interconnection is proven unless disproved	Rejected as overclaim	MathGov does not require universal pairwise connectivity or metaphysical proof. Public claims remain bounded to an auditable decision architecture and testable research program.

Exact accepted corrections

Canon v12.4

- Preserved the governing cascade and all non-compensation rules.
- Added the missing rights-floor calculation bridge and explicit relation between rights-specific and ordinary impact streams.
- Added a reviewed-empty-set convention without allowing unknown-as-zero.
- Generalized UCI to applicable-component renormalization.
- Completed stream-symbol migration in phantom-instance and conformance surfaces.
- Repaired appendix uniqueness and final-document termination.
- Marked prior v12.3.x material as lineage where it could be misread as current.
- Updated current SGP interface references from v8.1 to v8.3 while preserving historical crosswalks.

SGP v8.3

- Preserved MPS/FPP/GPR/SPR/ICP/RMCP/P100 type separation and Human FPP-100.

- Preserved the open P100 plateau and capacity-versus-authority firewall.
- Consolidated the controlling RMCPRecord minimum field list.
- Recast the overlapping field list as a nested dimension-profile subrecord.
- Marked v8.1/v8.2 release notes as lineage where appropriate.

Companion standards

- Agent v12.2 current cards, pins, runtime records, and audit-flag wording synchronized.
- Primer v4.2 current SGP explanation and exact pins synchronized; historical patch notes marked as lineage.
- ripple.md v5.3 wrapper G1-G5 explicitly distinguished from Canon stages; current matrix deduplicated.
- WDBIP v1.4 identity and schema migration completed without changing seven dimensions or creating a gate.
- CSV v2.2 and Cascade v2.4 current WDBIP/wrapper pins synchronized.
- RLS Validation v2.4 Level 1 study barred from PCA/EFA/CFA and 49-cell latent-structure claims; later analysis requires separate preregistration and sample justification.

Workbook binary audit

Check	Result
File type	Genuine XLSX OOXML package
Formula cells	2,810
Formula errors after recalculation	0
External workbook links	0
VBA/macros	0
Defined names	6; verifier-checked
Calculation settings	auto; fullCalcOnLoad=1; forceFullCalc=1
Active sanity checks	88
Sanity result	84 PASS; 0 FAIL; 0 ERROR; PASS WITH MANUAL REVIEW
Canonical INVALID flags	0
ESCALATE flags	0
REVIEW flags	1 intentional NONDECISIVE_GAP_REVIEW
PLSS sensitivity	Four constructions complete; ranking stable; decisiveness remains non-deterministic
Opening/navigation	How_To_Use first; Release_Notes second; current v12.4 sync third; historical sync later
Claim boundary	Worked-run exemplar only; not validator, empirical validation, ProofPack, or deployment certification

The 640 blank cached formula values were individually classified after recalculation: 569 legitimately evaluate to an empty string and 71 to blank/null; zero evaluate to a nonblank missed result. The release does not fabricate cached values. It sets explicit recalculation metadata so capable spreadsheet applications recompute on load.

Package evidence invalidating false positives

- Reproducibility Standard v1.2 and RLS Validation Workbook v0.2.
- Canonical state registry, transition matrix, maturity register, run schema and validator.
- WDBIP and SGP RMCP schemas, validators, positive vectors and negative vectors.

- README, LICENSE, CHANGELOG, source hierarchy, version manifest, release manifest, SHA-256 ledger and verification layer.
- Canonical Markdown plus genuine OOXML DOCX and PDF mirrors.

Verification results before final hash freeze

- Current-pin and core-set verifier: PASS.
- Semantic, cascade, type and claim-boundary verifier: PASS.
- Formula, severe-rights, PLSS and workbook-interface verifier: PASS.
- DOCX/PDF format, schema, vector and bounded-replay verifier: PASS.
- Changed DOCX render review: PASS; professional table formatting preserved.
- Workbook visual review: PASS; existing formatting preserved and navigation improved.

Claim boundary and release decision

This patch establishes internal and procedural conformance of the shipped artifacts. It does not establish that evidence inputs are true, weights are universally valid, thresholds are empirically calibrated, rights interpretations are legally controlling, physical actions are safe, digital systems are conscious, or MathGov outperforms alternatives.

Decision: retain MathGov Core v12.4 / SGP v8.3 as the component line. The accepted changes are pre-publication release-lock corrections and clarifications, not a new architecture or threshold regime. Freeze hashes only after the final verifier passes from a clean extraction.
