

MathGov Core Component Map — v12.4 / SGP v8.3

Release: MathGov Core Release 2026.09 v12.4 / SGP v8.3 - Calculability, Type-Integrity, and Cross-Artifact Synchronization Public Research Source Release

The operational core_15 bundle contains fourteen DOCX reading mirrors and one XLSX worked-run exemplar. This map is a coordination artifact, not a sixteenth governing core component.

Component	Exact current version	Governing role	Maturity posture	Non-collapse boundary
RippleLogic Canon	v12.4	Principal governing decision architecture	Tier 1–3 research-source specification	Not empirical validation, legal authority, or deployment certification
Sentence Gradient Protocol	v8.3	Moral-patienthood, protection, participation, power, ICP, RMCP, and P100 interface	Research-source protocol; calibration provisional	Not a consciousness detector; capacity does not grant standing or authority
ripple.md Standard	v5.3	Portable assurance wrapper	Procedurally reproducible wrapper	Does not supersede the Canon or create a new gate
Agent System	v12.2	Runtime controls, operator authority, intervention, and execution records	Implementation-research architecture	Prompt compliance is insufficient enforcement
CSV Gate Standard	v2.2	Compact containment and structural-viability routing	Procedural standard	UCI/HOI remain diagnostics inside CSV
Cascade Standard	v2.4	Compact five-stage implementation map	Specification summary	RG → RF/NCRC → TRC → CSV → RLS; no sixth gate
Reproducibility and Use Standard	v1.2	Minimum replayable kernel and use profiles	Procedurally reproducible	Reproducibility does not prove evidence truth
WDBIP	v1.4	Welfare measurement and construct boundary protocol beneath RLS	Validation provisional	Not an eighth dimension, option gate, or moral-status system
RLS Validation Protocol	v2.4	Study and falsification design	Level 1 study-ready	Reliability, validity, and calibration remain unestablished

Component	Exact current version	Governing role	Maturity posture	Non-collapse boundary
Foundations Primer	v4.2	Informative human doorway	Informative	Canon controls conflicts
Public Introduction	v12.4	Shortest teaching doorway	Informative	Eligible(a) is teaching shorthand only
PC-AEP	v2.1	Physical/causal evidence profile	Domain-warrant interface	Not a physics engine or safety certificate
MFDI Standard	v2.1	Claim typing, falsification, dependencies, and re-derivation	Methodological record standard	Does not generate external truth
Source-Coupling Integrity	v2.1	Capability-source and source-debt discipline	Diagnostic standard	Output performance is not source-coupling evidence
Aligners Sheet	v5.4	Tier 2 worked-run exemplar and audit aid	Formula-linked bounded exemplar	Not a validator or reference calculator

Governing precedence

Markdown Canon → normative companion Markdown → schemas and validators → derived DOCX/PDF reading mirrors → teaching and worked-example surfaces. Public canonical status additionally requires the exact repository tag, manifest, and SHA-256 set to be synchronized.

State-semantics and release-integrity note

The v12.4 release recognizes TRC_NOT_TRIGGERED as a governed pass-equivalent routing state only after a complete negative catastrophe-relevance assessment. It also requires non-dilutive evaluation of the base catastrophe profile and every active extension profile. These rules are owned by the Canon and mirrored in the state registry, transition matrix, schema, validator, Cascade Standard, Reproducibility Standard, and public teaching surface.
