

MathGov v12.4 / SGP v8.3

Fruition Finalization Report

MathGov Core Release 2026.09 v12.4 / SGP v8.3 - Calculability, Type-Integrity, Cross-Artifact Synchronization, State-Semantics, and Non-Dilution Public Research Source Release

20 July 2026 | Pre-publication release-integrity record

Executive verdict

The feedback was dispositioned against the actual complete release bytes. Only reproducible improvements were adopted. The canonical five-stage architecture remains unchanged, while state semantics, non-dilution, SGP evidence typing, workbook proof pointers, and machine enforcement are now synchronized.

Finding class	Disposition	Reason
State semantics and TRC trigger state	Implemented	Corrects a real contradiction between tier rules and formal qualification.
Catastrophe-cell extension dilution	Implemented	Prevents unchanged base catastrophe exposure from falling merely because new cells are added.
SGP Level 0 versus NOT_EVALUABLE	Implemented	Prevents missing evidence from becoming negative evidence.
Agent/workbook interface defects	Implemented	Restores floor compliance, non-decisive language, proof-coordinate integrity, and correct Gap terminology.
Missing formats/assets/release support	Rejected	The complete ZIP contains genuine OOXML, schemas, validators, manifests, licence, tests, reports, and hashes.
Public repository/site synchronization	External publication step	The local package cannot itself update public channels; atomic publication remains required.

Implemented improvements

- Typed RG qualification and claim-refusal states.
- Governed TRC_NOT_TRIGGERED state with complete negative assessment and reopen triggers.
- Independent pass requirements for base and extension catastrophe profiles.
- Floor-preserving uniform residual allocation.
- Tier 2 CSV and uncertainty synchronization.
- SGP Level 0/NE correction and provisional RMCP-P100 reference-anchor wording.
- Agent worked-run and workbook proof-locator corrections.

- Executable schema, validator, positive/negative vectors, and master-verifier integration.

Final boundaries

Release verification is evidence of internal conformance, not proof of empirical validity, legal authority, physical safety, consciousness, moral truth, democratic legitimacy, superior decisions, ProofPack completion, Tier 4 status, or high-stakes deployment readiness.

Final decision

FINAL AND READY FOR THE DECLARED PUBLIC RESEARCH-SOURCE, TEACHING, STRUCTURED-RUN, REPLAY, AND VALIDATION-PREPARATION PURPOSES.

Public canonical status begins only when the exact verified package bytes, hashes, tag, citation record, website, and download links are published atomically.
